

Specialist in lift electronics

A photograph showing the interior of a modern lift. The walls and ceiling are made of clear glass, through which the internal mechanical components of the lift are visible. These components include several vertical and diagonal orange-painted metal beams and plates. The lighting is bright and even, highlighting the clean lines of the glass and metal.

P DAHL

The full experience

For almost 25 years P DAHL has specialized in lift electronics and has slowly grown to a firm position as the largest supplier of lift electronics in northern Europe. Early on we understood the importance of not only supplying high quality products but also to supply knowledge.

Our support team have always had an important position in the company and always worked close to production, sales and development. Supplying information and knowledge to our customers have been a key element when building our reputation.

More than once we've helped customers with more than just the products we supply, so the step to supply more than just electronics wasn't a very big one.

Today we can offer our customers the full experience of our knowledge and we supply everything from complete lift solutions to lift electronics, motors, speech processors and control units.

25 years of building great lift systems

Combining the component to build a great lift requires great skill. In a perfect world every lift would have separate machine rooms and spacious shafts, but the reality is seldom that. Space is often an issue and skill is required to fit everything together.

At P Dahl we have a team of technicians specialized in different fields - ready to help you put together a great lift.

Whether your lift is a new lift or an old lift requiring modernization we can supply whatever you need. We work with the most well-known producers in the business to find products that have the high quality and reliability that is required to build great lift systems.

P DAHL has for more than 20 years developed electronics and lift control units. We've been a part of the lift industry for many years and supplied the world's leading lift companies with electronics. We've built open systems that is easy to adapt and to build in to any system. We've always worked close to our customers and been responsive to their need.

This has enabled us to build a product line that is very versatile and competitive. Quality and durability has always been key words in production and development, and we know the value of a happy, returning customer.

For things we do not produce ourselves we look to producers that have the same high standards as ourselves. Well known producers with a good history and innovation to keep their products updated. We have several partners we've worked with for many years.

Sometimes we find that there is a void to be filled, when there is some functionality that are missing that could improve the lift. In those cases we bring our development team together to let them work their magic.

The S4 is of coarse one of those products. The S3 is still going strong, but as we move into the future. More and more functions are demanded and remote control is one of these functions that we feel will be essential.

BCU01 is also a product we felt was missing. The brake control unit allows for better control of the lift brake system, reducing the number of transformers needed and limit the wear of brakes and brake resistors.

Putting in all together

Being able to supply all the parts of the lift gives us a powerful control of the lift system. We can make sure that the entire lift works together as good as it can. We can select each part to be a perfect fit in a well-oiled machine.

Our main strength is the full package and that is where we excel. Using CAD tools we put together a lift based on the building requirements. This powerful tool can ensure that the lift supplied fulfills all requirements when it comes to safety and support. We can easily calculate that every detail of the lift can manage the forces it is exposed to.

This allows to create lifts that are of optimal size and strength. There is no need to overcompensate details to counter bad calculations. This opens up for leaner and lighter lift without decreasing security. A lighter lift also means a lift that is more power efficient and easier to install.

Putting your lift in our hands will ensure that you on the day of delivery gets a lift fully configured and ready to install, complete with all required papers and documentation.

Our strength - the complete package

P DAHL has since the start specialized in lift systems and since many years we've been northern Europe's largest supplier and manufacturer of lift electronics. With vast knowledge of lift systems and experienced technicians we can offer our customers the complete and fully configured lifts of high quality.

Reliable and energy efficient lifts

The lift package we deliver is complete packages where everything from the shaft details to the lift car, electronics and interior has been selected to form a lift which is reliable and have optimal energy efficiency for every need.

We offer two basic packages that we then adapt individually based on our customer's requests and demands.

Whether the lift will be installed in a few story apartment building, a high office building or an industrial facility we can tailor the system for your needs.

Speed loading capacity and comfort

To find the balance between speed, loading capacity and comfort the fits the customers need is our strength. With two basic configurations - rucksack or straight, we cover most uses. Rucksack offers a simpler lift made for smaller shafts and slower lifts.

Straight configuration is the solution for lift systems where the shaft don't have the same limitations. The straight configuration offer a more stable system which means that the speeds can be higher and the loads can be bigger without limiting the comfort.

Blocking - a question of speed and load

By using different rope ratios you can use the capacity of the motor in different ways. By using pulleys you can redistribute the load of the motor.

Depending on the load and the speed we use 1:1, 2:1 and 4:1 ratios.

With or without machine room

The placement of the lift and its main purpose is also a factor when you chose to use a machine room or not. A machine room requires space but also decreases the noise. While putting the machine parts in the shaft requires less space.

CAD to ensure the installation and the optimal design

By using CAD programs we can ensure that the lift is optimized for your building. Using CAD we can figure out the best way to build a lift when space is an issue and we can calculate which parts of the lift needs to be reinforced to maintain the load of the lift, without the need to overcompensate and without restricting security.

This allows for smaller, more optimized and cost efficient lifts which are easy to install when we early on can adapt features to fit in the shaft and avoid surprises when the lift is delivered.

The interior - the face of the lift

The lift car, floor indicator, call buttons becomes the face of the lift and the travelers connection to the lift system. Which is why it can be the most important part of the lift, depending of the placement and purpose of the lift.

For office buildings or exclusive apartment buildings the lift can be an important tool to mediate success, prosperity, quality and ambition.

We make sure to tie up the complete picture by supplying a lift car that lives up to the expectations of the customer.

The Control unit - the brain of the lift

The electronics behind it all is delivered fully configured and ready to be installed. Our lift computer is the most sold lift control unit in Sweden and offer almost limitless configuration possibilities and uses an interface that is as easy to use as reliable.

Documentation - the last piece of the puzzle

When the lift is delivered and ready to use you can use our documentation portal to download all documents necessary to maintain the lift. It will be easy to find documents for certification and future maintenance.

Controlling the lift

The core of P DAHL has been the creation of great lift control systems. Systems easy to configure, install and maintain. For more than a decade the S3 has dominated the nordic lift market. The S3 has been hard to follow, but after years of development it's successor will soon make its appearance...

Stability and performance

Launched almost two decades ago, the S3 has never stopped evolving. It's stable architecture was built to adapt, and the power to adapt has allowed it to still be a powerful and competitive lift control unit.

Earlier this year we launched products that allowed you to control and configure your lift through an app available both to iPhone users and Android user.

Using the CAN bus protocol, we've designed a number of products to make installation even easier. Products that limit the number of cables needed to install the lift system.

Taking the next step

The S4 has been long in the making. Thousands of hours of development is finally at an end and the result is a control unit that is a product of its time.

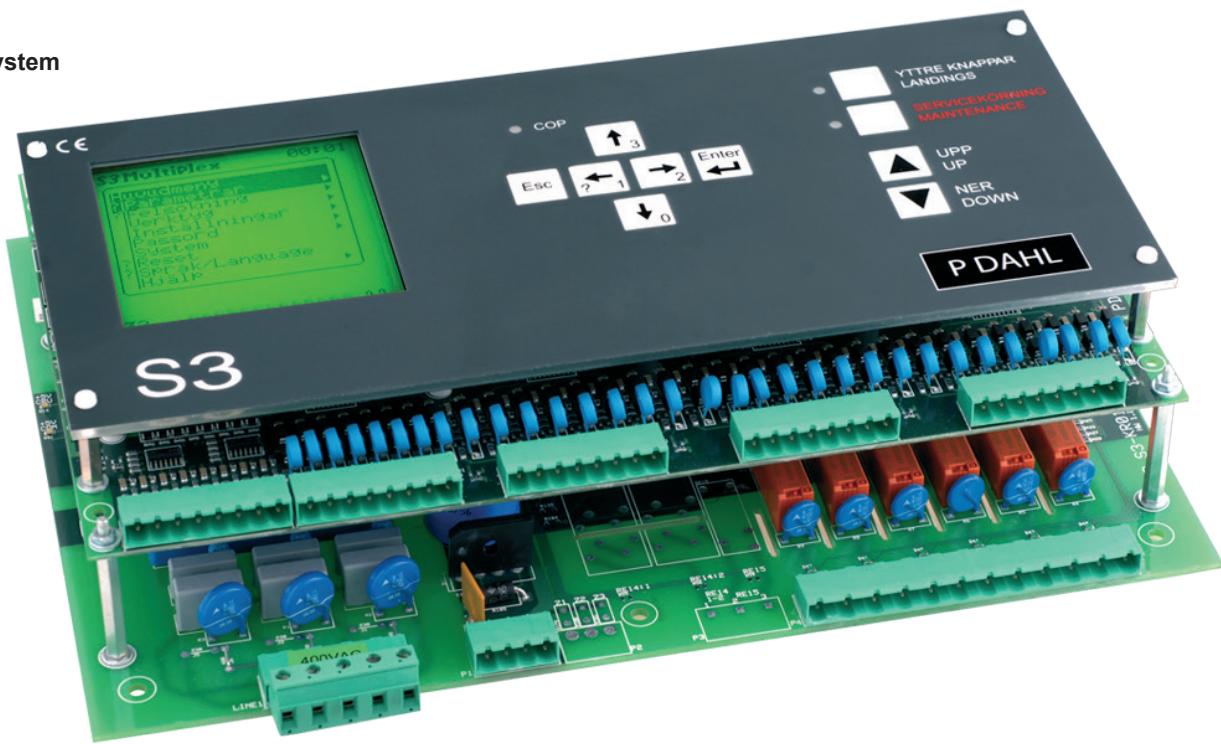

Our demands have been high and we wanted a product that would live for another 20 years. A product that is versatile, stable and prepared for what the future will bring.

Ignoring aging display system and keyboards, we've chosen to focus on a system configurable entirely with a connected device, such as a laptop, smart phone or tablet.

S3

Lift control system

Launched almost two decades ago, the S3 has never stopped evolving. Its stable architecture was built to adapt, and the power to adapt has allowed it to still be a powerful and competitive lift control unit.

Earlier this year we launched products that allowed you to control and configure your lift through an app available both to iPhone users and Android user.

All in-/outputs are optoisolated, the processor works in a galvanic separated environment. The computer has a built-in display and a keyboard, which makes it possible to perform all programming of the system on job site.

In case of errors on the lift system, this will be stored in the computer, together with the time and date, providing effective troubleshooting for the technician. The system clock will keep running even during voltage drops with the help of a back-up capacitor.

The S3 control system is available in a large variety of types. The difference between the types consists of different hardware configurations. The hardware configuration stretches from 8 inputs, 8 outputs, 16 in/outputs and 10 relay contacts to 16 inputs, 16 outputs, 48 in/outputs, 18 relay contacts and 2 CAN buses.

The S3 positioning system handles magnetic sensors, photocells and incremental encoders.

The software is written in an event based programming language, which simplifies adding of new features even for big and complex applications. The lift control system handles both 24V positive and negative logic.

Features

- Multi language support
- 2-32 floors (more on request)
- Lift in group 1-8
- 2 door sides
- Pushbutton controlled with occupied lamp or Down/Up-collective
- Phase failure detection
- 24-230 VAC inputs for safety circuit (see part number)
- Surveillance of the motor temperature
- Travel time high-speed or low speed
- Surveillance of contactors
- Pawl device
- Fan control for cabin
- Fan control for lift motor
- Fan control for cabinet
- Built in thermostat for control of the temperature of the cabinet
- Swing door and/or slide doors
- Door open in floor (not for EN81 installations)
- Zone system for levelling (with open or closed door) and early door opening
- Fulload / Overload
- Parking floor, two different destinations
- Independent service
- Fire service
- Floor indicator
- Arrival signal
- Suspension of landing calls
- Priority calls for landings and car
- Fire service two landings
- Fireman service
- Key code
- Floor indicators decimal and/or binary
- Direction arrows
- Acoustic arrival signal
- Hydraulics/1speed/2speed/VVVF
- Floor positioning with encoder or photocell sensors with flags
- Short travel
- Fault history with type, time and date
- Fault alarm from the computer
- PTC protection - No fuses for the internal 24VDC supply
- 2 CAN-Bus Interfaces

S4

Lift control system

When developing the successor of S3, Swedens best selling control unit since ten years back, we didn't know how far we would go. Expectations were high - so there could be only one answer - all the way.

Perfection takes time and so we chose not to rush - and today we can present the S4 - the next step in control system evolution.

Easy to use, easy to control

The S4 has been long in the making. Thousands of hours of development is finally at an end and the result is a control unit that is a product of its time.

Our demands have been high and we wanted a product that would live for another 20 years. A product that is versatile, stable and prepared for what the future will bring.

Ignoring aging display system and keyboards, we've chosen to focus on a system configurable entirely with a connected device, such as a laptop, smart phone or tablet.

Built on a reliable system

The S3 has been in production for more than ten years and is the most sold control system in Sweden. We knew that its successor must be equally reliable and share its high quality.

Using the tools of today

The key feature of the S4 was to supply an easy to use control unit that can be installed and configured in minutes. Using our iPhone or Android app, you can easily configure the lift and setting it up in minutes.

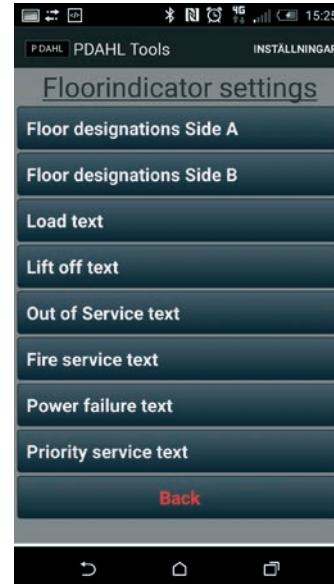

Configurations can be backed up and restored or even mailed to our support if help is needed.

S4-BT01

Bluetooth Unit

The S4-BT01 is a bluetooth unit which allows you to control your lift control unit with an Android or iPhone app. The S4-BT0 is connected to the CAN bus and also have additional inputs and outputs.

The app allows you to set up your lift in minutes with easy to use menus and options. You can also store and backup settings and import received settings.

S4-I10-BT

Bluetooth Connected I/O Unit

The S4-I10-BT has the same features as S4-BT01 and also has 10 additional inputs that can be used to connect more units.

HV02

Overspeed Governor

HV02 is a unique solution of supervising the speed of the lifts. The supervision is performed by two separate units (microprocessors) supervising the brake and the speed of the lift. In case of overspeed or other errors, HV02 shuts down the lift to prevent dangerous situations. The lift is not allowed to make new starts, until a technician eliminates the error, and resets the overspeed governor.

Each unit has its own separate power supply. The shaft encoder feeds pulses to the microprocessor. The processor measures the time between these pulses and if the time between these pulses is too short then the output relay falls. The output relays are fallen when the lift is parked. The output relays are activated by an external signal when the lift starts.

S4-CTC01

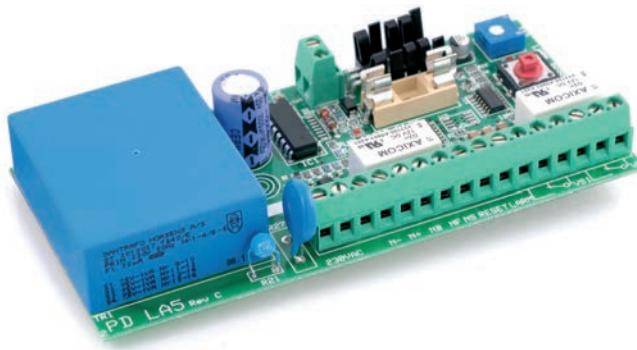

Control Unit

S4-CTC01 is a multifunctional control card for your lift. Install it in the car roof and control door machines, lights, fans - whatever you need.

The S4-CTC01 has 16 (4x4) inputs, 8 (6+2) relays, built-in buzzer and 4 outputs. The input operates in both positive and negative logic – you can easily change from one to the other at any time by moving a jumper on the circuit board. The state of each in- and output is visually indicated with LED indicators.

There are 6 relays, divided into 2 groups to control the doors. Dividing the relays into groups makes it easy to disable a door side by just unplugging the connector.

The S4-CTC01 is connected to the CAN-bus of the S3 control systems, which provides a fast and easy installation, with a minimum of cables. S4-CTC01 has a built in termination to provide an as good as possible communication with the controller.

BCU01

Brake Control Unit

The BCU01 is a control unit used to control two individual brakes. The output voltage can be programmed in the BCU01 and allows a better control of the power supply.

Using the BCU01 means that you can limit the number of transformers used, thus require less space and lowering the costs of the system.

The BCU01 maintains the power supply to the brakes which means that ramping can be controlled. This reduces the wear on the brakes and brake resistors.

LA5

Standby Unit

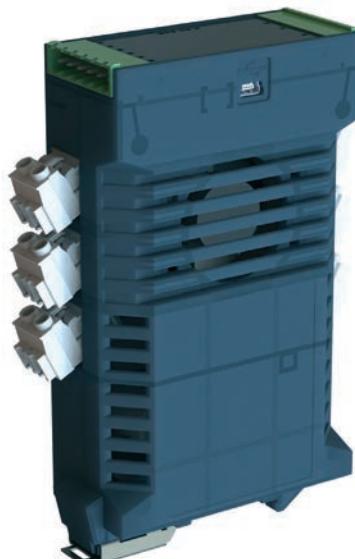

The LA5 handles emergency power supply during power failure.

The charging is divided into three steps. During the first step the accumulator is charged with a very small current to prevent damage to a discharged accumulator.

When the voltage has reached the lower limit for normal charging the accumulator will be charged with maximum current, this is the second phase. In the third step the charge will decrease and the standby unit will keep the accumulator charged with a maintenance charge.

During the first phase the accumulator cannot be loaded.

| | |
|----------------|--|
| Accumulator | 6V 3Ah 12V 1,2Ah 12V 2Ah/2x 12V 2Ah |
| Charge current | 0-250mA |

POSITIONING

The incremental encoder uses a belt running through a sensor to read the position of the lift. The encoder reads pulses from the sensor and translates them into distance with the help of the lift speed and a number of calibrating tools.

Shaft positioning, Counter

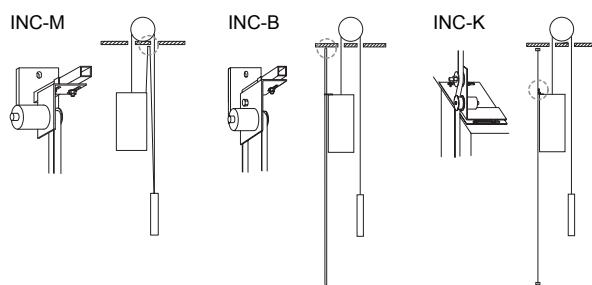

The incremental encoder set combined with the S3 control system gives you a high precision positioning system. There are four different incremental encoder sets, the encoders are the same (50p/rev) but the mechanical parts are designed to fit the lift depending on the type of lift and the amount of space in the shaft.

Motor Feedback

The speed control set includes the brackets needed for an easy and exact installation of a puls generator (encoder). Along with the axle coupling (included in the set) and the pulse generator bolt (not included in the set) this is all you need for a closed loop speed controller.

There are two different sets, the first one is a floor stand and the second one is mounted on the side of the motor bed.

Axle Coupling

The axle coupling consumes the vibrations and deviations in the motor axle. It allows a maximum $\pm 5\text{mm}$ of radial and axial deviation. The coupling is available for three different axle combinations.

Pulse Generator Bolt

The pulse generator bolt allows you to attach the axle coupling to the motor axle. The bolt comes in four sizes M12, M14, M16 and M20. It is delivered with 2 nuts to lock the bolt in the motor axle.

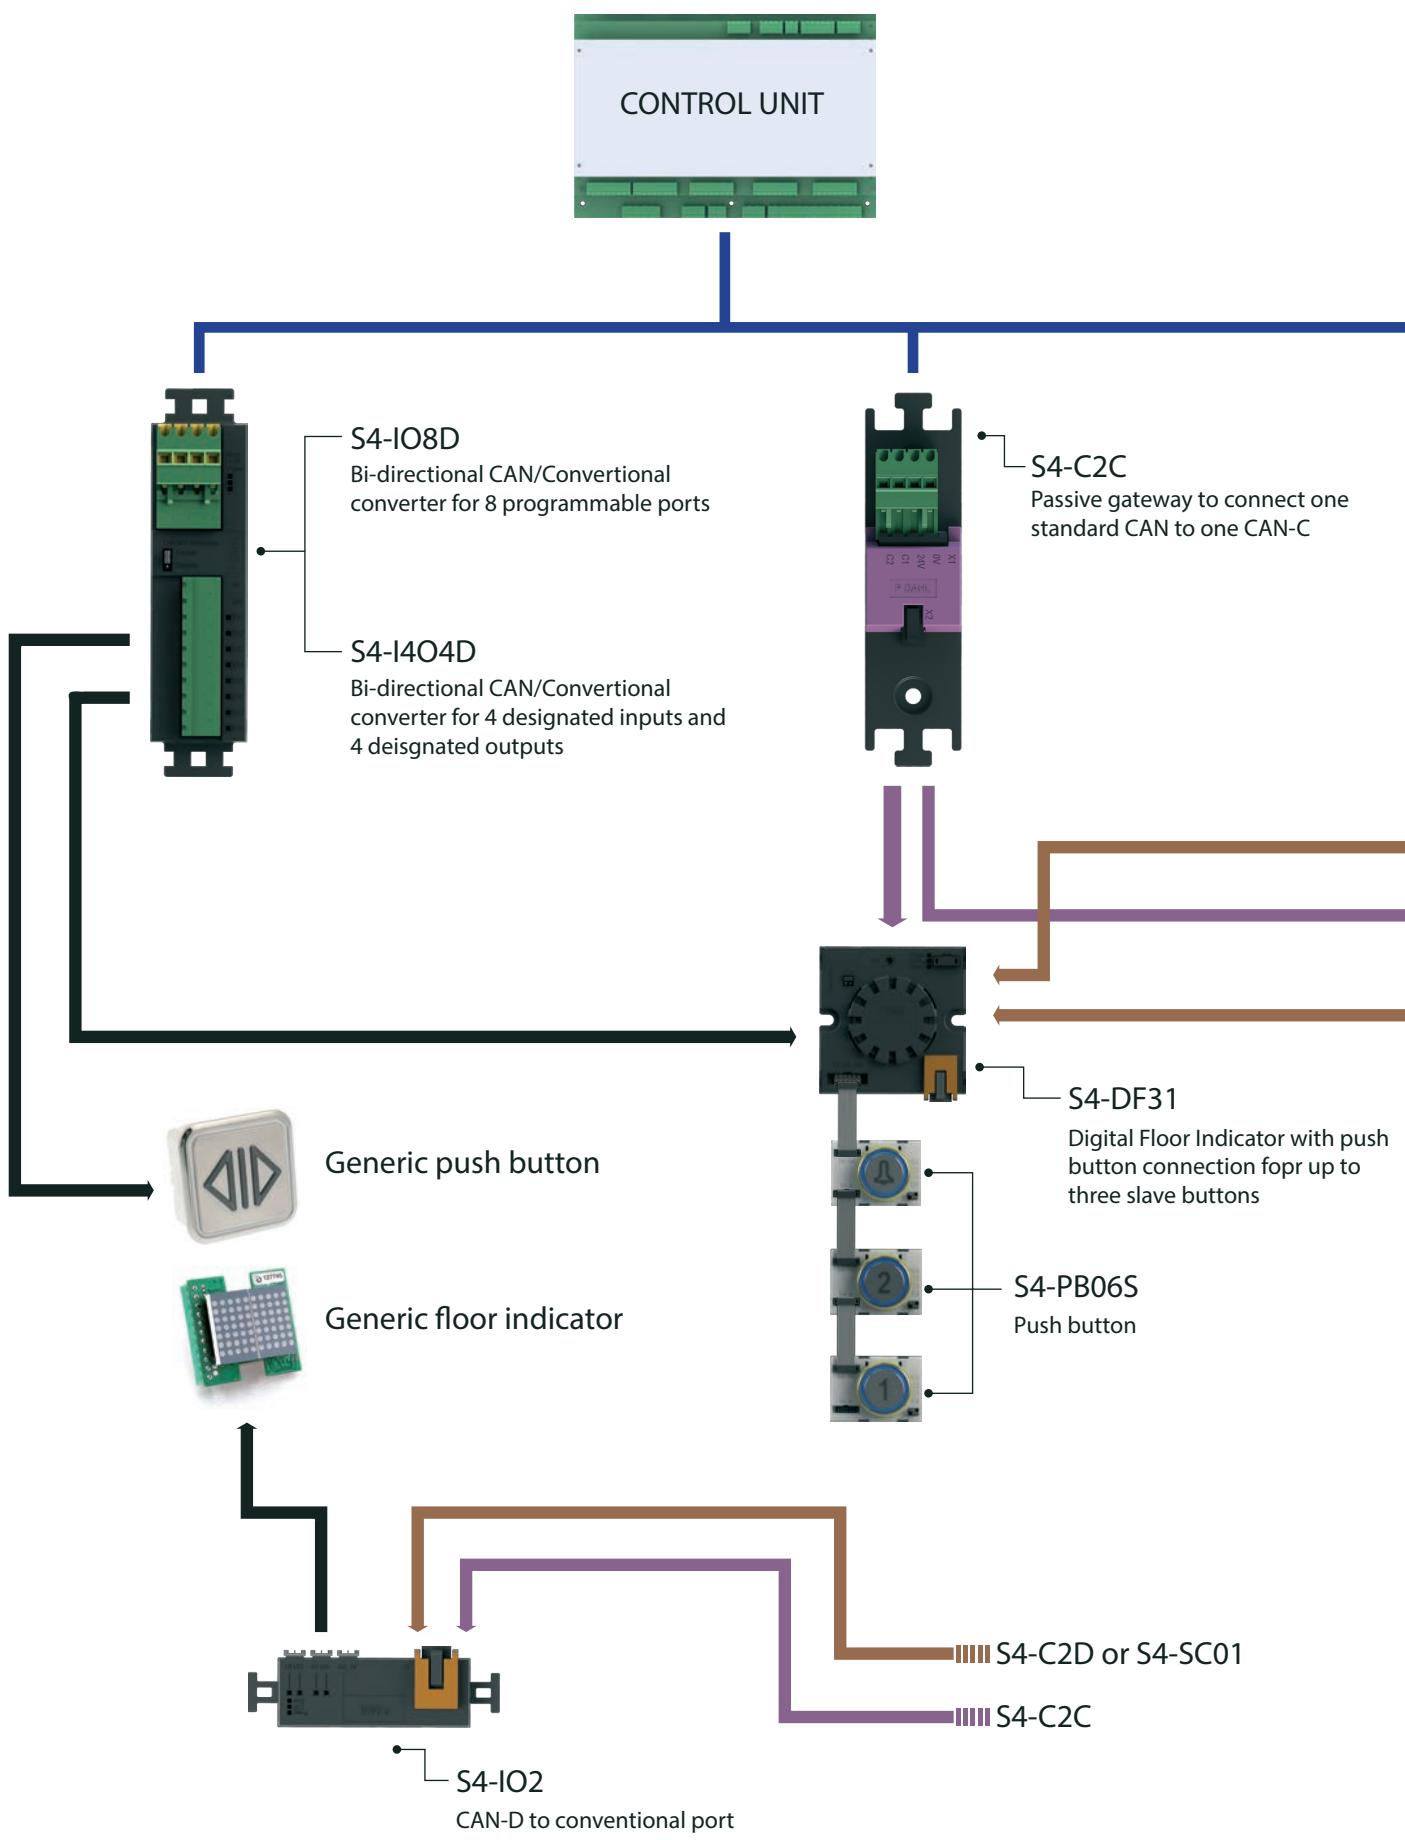

Photocell

One of the traditional ways to position the lift is to use flags and photocells in the shaft. We have developed an easy and swift-to-install set of brackets, where all needed for the installation is included. Note that flags are not included in the set, the number of flags needed depends on the type of lift and number of the floors. The sets consist of:

- Brackets
- Photocells, (2 or 3 depending on type of lift)
- Piano-wire
- Expander bolts

I/O Units

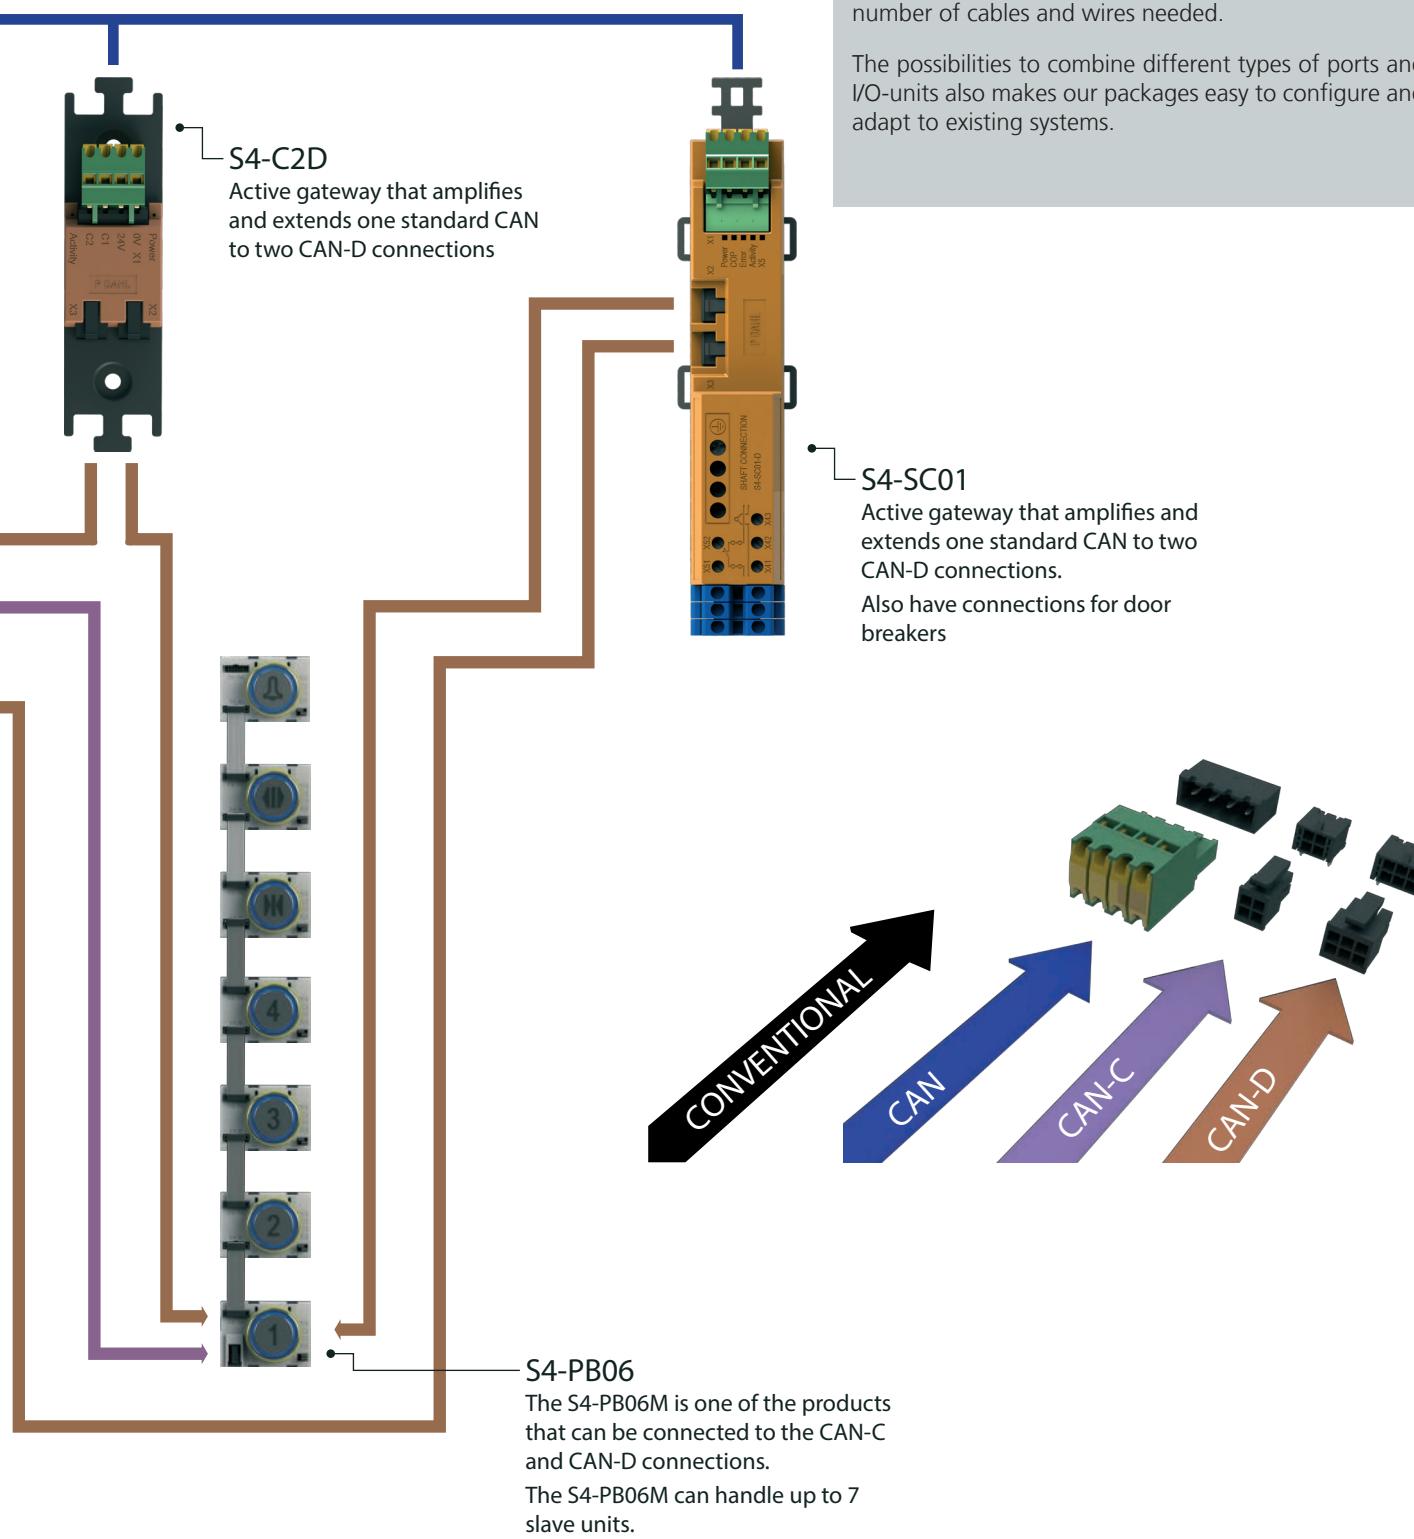

Easy to install. Easy to connect.

P DAHL has always strived to create easy-to-install solutions. One of the key parts of the company is our Electrical Packages division that preinstalls and preconfigures solutions for our customers.

We have a very good understanding of lift installation and configuration and strive to create and produce solutions that are as easy to install as possible.

As a part of that solution we've developed a wide array of I/O units that allow for easy connection, limiting the number of cables and wires needed.

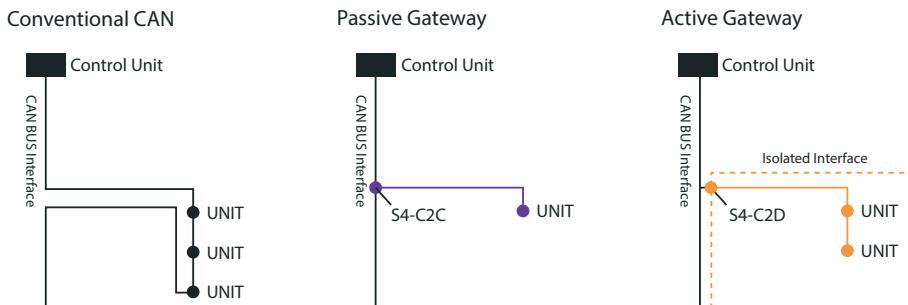

The possibilities to combine different types of ports and I/O-units also makes our packages easy to configure and adapt to existing systems.

CAN BUS Gateways

When lifts grows larger - spanning more floors and using more connected devices the cabling and interfaces can become an issue.

Using a gateway is a simple solution that allows technicians to reduce the number of cables used. Using an active gateway also reduces the interference in the CAN Bus system by encapsulating the connected units from the rest of the CAN bus system. An active gateway also amplifies the signal, allowing for longer wiring and even larger systems.

S4-SC01

Active Gateway and door control

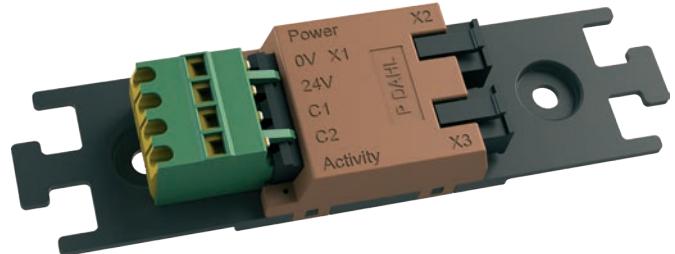

The S4-SC01 is an active gateway which enhances the CAN signal and allows for two CAN units to connect.

The S4-SC01 also allows the connection of two door contacts and facilitates fault tracing when the S4-SC01 can report more precisely when a door contact is open.

S4-C2D

Active Gateway

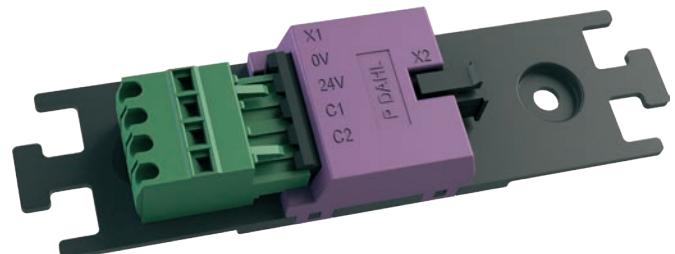

The S4-C2D01 is an active gateway allowing for the connection of two S4-PB06MD or S4-DF12. The active gateway allows longer cables to be used, extending the signal even further.

S4-C2C

Passive Gateway

The S4-C2C01 is a passive gateway allowing for the connection of one additional S4-PB06 or S4-DF12.

IO-Units

P DAHL has a number of IO-units designed to make installation as easy as possible. The units add extra in-/outputs to the CAN-bus for each card you connect.

The IO units can be placed anywhere in the lift system and can be mounted either on a DIN-rail (for use in car top control) or directly on the plate (for use in car operating panels).

Most IO cards are connected to the CAN-bus (4-wire system), which means that there is no need to cut any cables – just peel the cables.

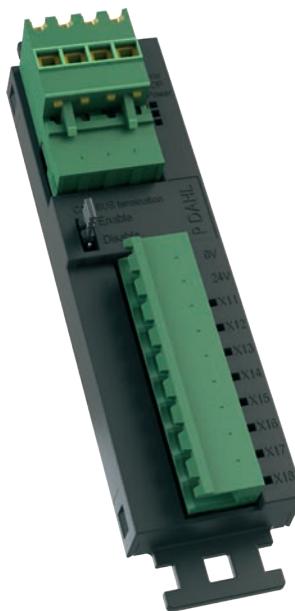

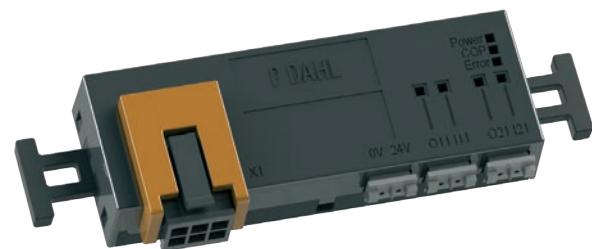

LED indicators indicate the state of each IO and the status of the CAN-bus connection. S4-IO8 is available for both positive and negative logic (both common minus and common plus).

S4-IO4

CAN Bus Hub

The S4-IO4 is a small CAN BUS unit with CAN-C or CAN-D input and 4 programmable I/O ports. The S4-IO4 is excellent when connecting push buttons which dont require that many I/O ports.

The S4-IO4 is a slim IO unit that is meant for installations where space is limited.

S4-IO8

CAN Bus/Conventional Converter

The S4-IO8 has 8 programmable bidirectional in-/outputs.

S4-IO8D

CAN Bus/Conventional Converter

The S4-IO8D has 8 programmable bidirectional in-/outputs.

S4-I404D

CAN Bus/Conventional Converter

The S4-I404D has 4 bidirectional inputs and 4 output.

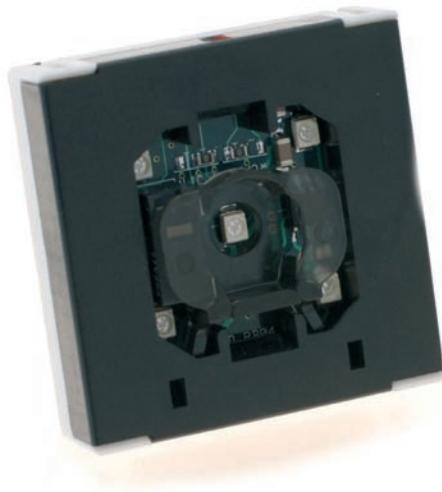

Push buttons

P DAHL has a long history of designing and supplying panels with state of the art push buttons. Materials range from brass, to polished steel with engraved or printed symbols and texts.

We deliver fully assembled panels with push buttons, built in buzzers, floor indicators, speech processors and emergency phones.

Our configurations fulfill the criteria's of the EN 81-70 standard. The buzzer is used for audible registration feedback (and as an overload buzzer) and the halo or center LEDs for visible feedback.

| | PB04 | S4-PB05 | S4-PB06 |
|----------------------|--------------|------------|----------------|
| Power supply | 24 VDC | 24 VDC | 24 VDC |
| Measures, DxWxH (mm) | 18x43x40 | 23,8x44x44 | 23x44x60 |
| Connection | Conventional | CAN-BUS | CAN-C or CAN-D |

PB04

Push Button

PB04 is a push button using conventional connections. PB04 is a perfect alternative when building smaller lift systems.

- Conventional interface
- EN 81-70 (both visible and audible registration feedback)
- Low power consumption

S4-PB05

Push Button

S4-PB05 is a series of standard CAN-bus connected push buttons. The CAN-bus connection is a 4-wire system, using the Quick Connection System (Phoenix QUiX-series), providing fast and easy installation. Connect a S4-PB05 master push button to the CAN-bus, this button hosts up to 7 slave pushbuttons connected with ribbon cable.

- Standard CAN-bus interface
- EN 81-70 (both visible and audible registration feedback)
- Stackable, up to 7 slave buttons per master button connected with ribbon cable. 45-500mm c-c.
- Low power consumption

S4-PB06

Push Button

The S4-PB06 is a push button based on the S4-PB05. The S4-PB06 has all the features of the S4-PB05 but is a slimmer version for installations that require less space. The connectors are also smaller and uses our CAN-C and CAN-D interface.

In addition the S4-PB06 has an extra set of halo lights which can be used to indicate special calls.

As with S4-PB05 the S4-PB06 uses a master unit to connect up to 7 slave units to the CAN Bus.

- CAN-bus interface
- EN 81-70 (both visible and audible registration feedback)
- Stackable, up to 7 slave buttons per master button connected with ribbon cable. 45-500mm c-c.
- Low power consumption
- Compatible with S4-PB05
- Depth only 23 mm

S4-PB05M-IO

IR/RFID Remote Receiver

The IORC IR/RFID receiver is a powerful tool to facilitate the use of car lifts or to just add extra security to your lift.

The IR receiver is installed into the panel of the lift. IR receivers are controlled by the IRRC01 transmitter that sends an IR signal to the receiver to control the lift.

The RFID receiver is also installed in the panel and allows the use of RFID tags to control the lift.

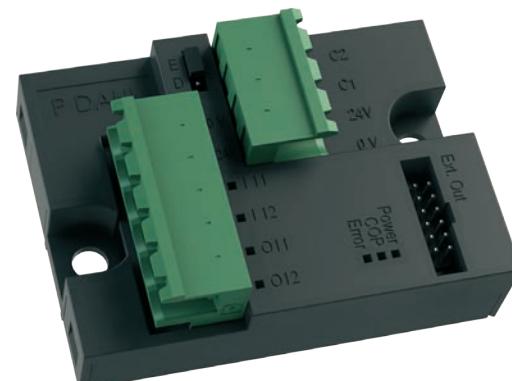

Pairing the transmitter with the receiver is done with S3/S4 main computer. Each paired unit can be programmed with different functions depending on the type of lift or security required.

Surface mounted box

Tight installations sometimes don't allow the installation of recessed buttons.

For these cases we've developed a surface mounted box to use with S4-PB06.

The box is only 23 mm deep and made of sturdy, durable plastic material that allows for fast and easy installation in most environments.

Digital Floor Indicators

We offer a number of different digital floor indicators with different features. All our floor indicators are easy to program and allow a large number of arrows and letters. The displayed information can either be scrolled-in or displayed in the traditional static way.

Our floor indicators aren't programmed on delivery, but programming is done in seconds. All you need is a PC, a programming cable and the floor indicator programming software for Windows - which you can download freely from our website.

When the floor indicator is connected to the S3 CAN-bus, programming is done from the control system (no cable or software needed). The floor indicator can be reprogrammed over and over again while running (this includes changing the number of floors, the name of the floors, way of mounting, text messages, the appearance of arrows etc.)

Features

- Static/Scrolled information
- Arrows
- Text messages (user defined)
- Small/Large digits
- Easy programming/reprogramming (onboard RS232 interface)
- Output for arrival signal
- CAN-bus connection
- Easily assembled in panel
- Programmable inputs
- Built-in arrival signal (optional)
- Built-in buzzer
- Available in both blue and red

DF04

Digital Floor Indicator

The DF04 is a floor indicator with several features. DF04 can be mounted either vertical or horizontal. This gives the floor indicator different features. When mounted vertically DF04 displays a large digit (10x7 dots, digit height 42 mm), when horizontally two smaller digits (5x7 dots, digit height 30 mm).

S4-MIO2

Digital Floor Indicator

The S4-MIO2 is a digital floor indicator with a larger display and new features. The S4-MIO2 has a 16x16 dot display which offers displayed information of higher resolution. The AS02 arrival signal can be built in as an option.

S4-MIO3

Digital Floor Indicator

The S4-MIO3 is a larger version of the S4-MIO2. With its 32x16 dot display it is ideal for displaying information demanding even higher resolution. The AS02 arrival signal can be built in as an option.

S4-DF12

Digital Floor Indicator

S4-DF12 is a surface mounted floor indicator. Only 23 mm thick, the S4-DF12 aims at installation that require less space for installation or where recessed indicators can't be used. The DF12 is fitted inside a durable surface mounted box. Using our quick connect system the S4-DF12 connects to the CAN bus system through the S4-C2C01 or the S4-C2D01.

The S4-DF12 can also be delivered with an optional speech processor.

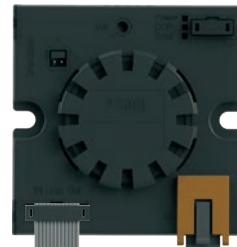

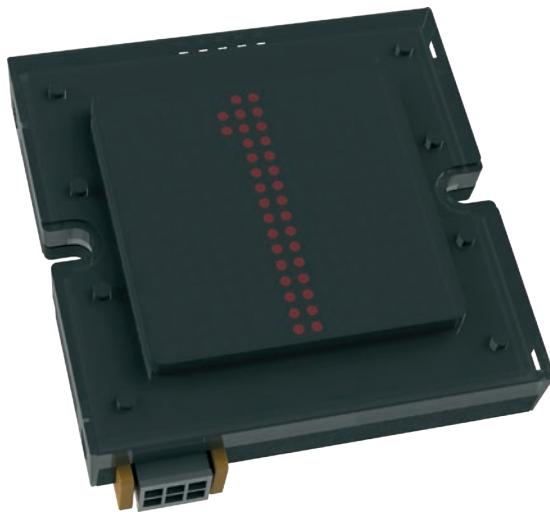

S4-MIO3 installed in a surface mounted box

SF-DF31

Digital Floor Indicator with push button connectors

S4-DF31 is a 16X16 dot digital floor indicator with push button connectors allowing 3 slave push buttons to be connected. The S4-DF31 also has a built in acoustic signal.

The S4-DF31 is a slim unit meant for tight installations. The unit is only 19 mm thick and can use either conventional, CAN-C or CAN-D interface.

S4-DF31 with three connected S4-PB06S push buttons

TFT Infodisplay

TFT High resolution floor indicator

Our high resolution information displays are an option for customers who demand high quality and easy to maintain lift information systems.

The display shows floor destinations and information stored in a cloud based system, which is easy for customers to maintain.

RSS-feeds can also be added for news and dynamic information together with weather information and local news if an existing internet connection is available.

Features

- Display WXGA
- 7", 10" or 15"
- 16M colors, 89° view angle
- Coretex A7 Dual Core
- 1GB DD3 RAM
- SATA HDD connector
- 3G, WiFi or Ethernet
- Full HD
- HDMI and VGA input
- LED background illumination
- Audio

SP02

Speech Processor

SP02 is a speech processor developed by P DAHL. SP02 has improved sound quality, media handling and storage. The speech processor is fitted with a MicroSD card slot which allows for considerably improved storage space.

The SP02 is easy to configure together with our control unit S3 and allows for hours and hour of music and sounds. When using music the speech processor fades out the music before the floor designation is announced and then fades it in again.

The SP02 is pre-configured on delivery but it is possible to use our SP02 software if you wish to modify settings and sound. Software for how to configure the SP02 is available at our website.

The SP02 delivered with a 512Mb MicroSD card.

| SP02 | | |
|--------------------|---------------------|-------|
| CAN Bus connection | • | |
| No. of floors | ∞ * | |
| Power Supply | 7-36 VDC | |
| Max current | Standby | 12 mA |
| | Music at max volume | 90 mA |
| Storage | | MP3 |

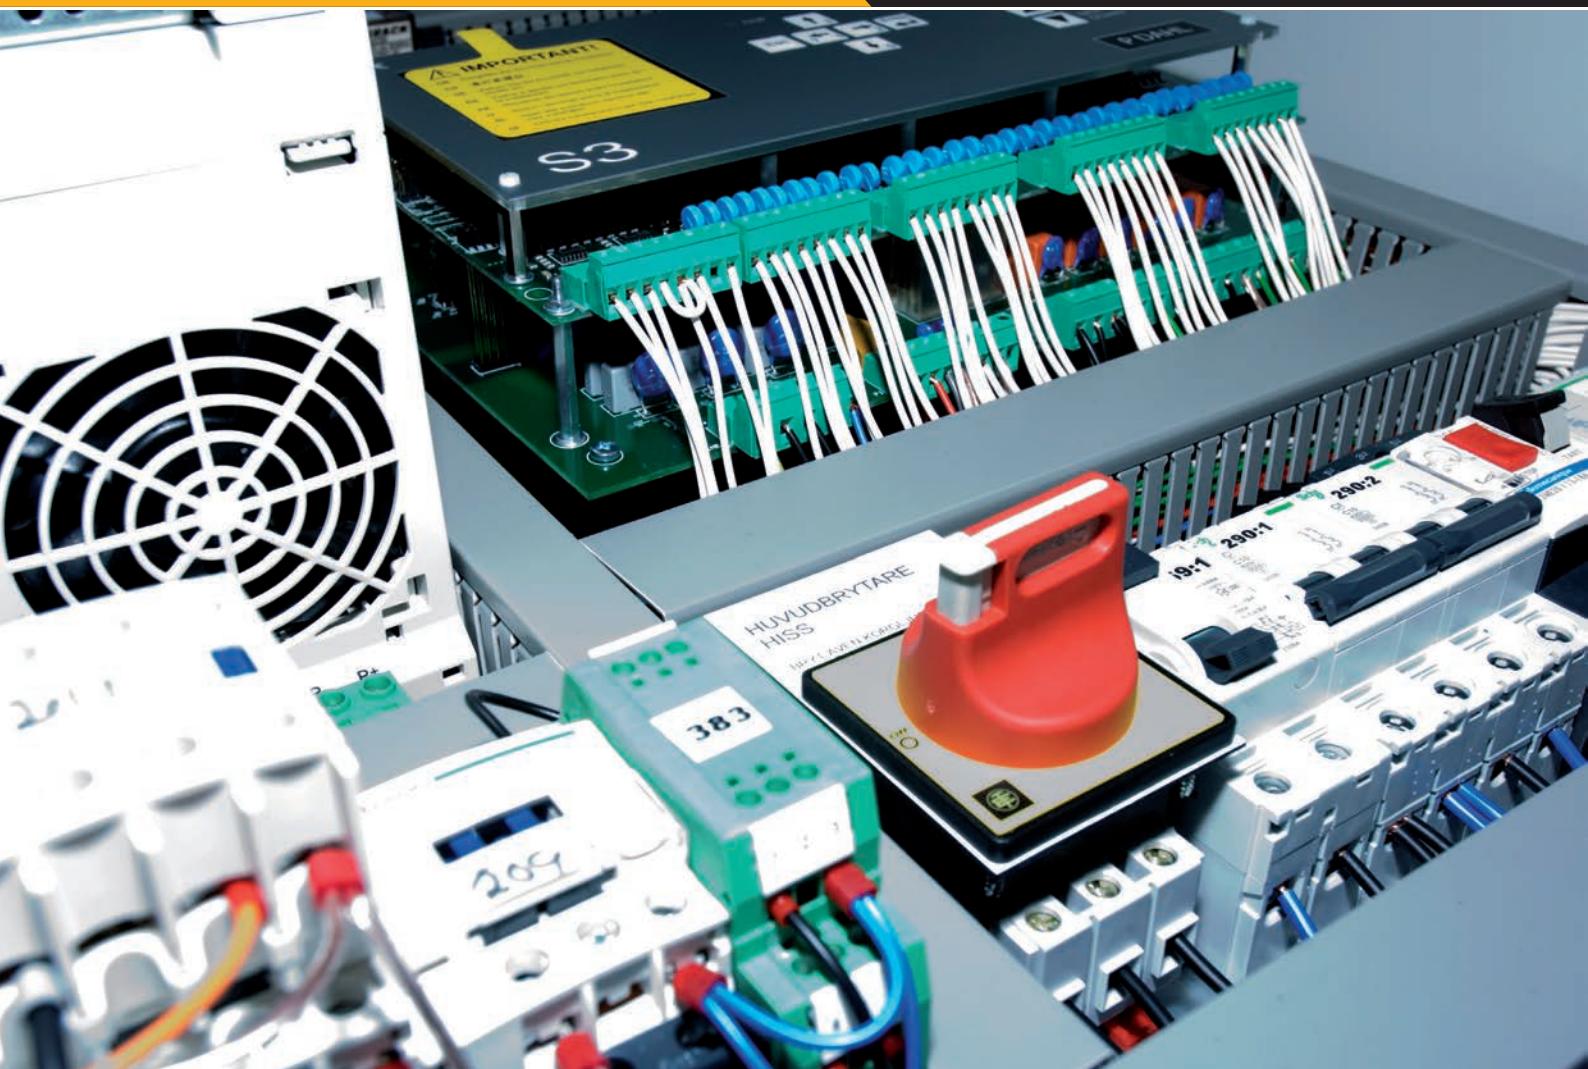

*) Only limited by storage space

Speech processor resources

P DAHL have a sound bank with the most common phrases in a number of languages. If a phrase or language isn't available we can arrange more recordings upon request.

We've used both female and male voices to record phrases

Electrical Packages

Today we build fully equipped electrical cabinets fitted with control system, connections, frequency inverters etc. We offer Car top Control cabinets, overspeed governor, shaft installation harness, overload sensors, shaft lightning, emergency systems and fully equipped panels with push buttons, floor indicators, speech processors etc.

Our packages come preconfigured and complete with all documentation and accessories needed to install the lift. When installed minimum configuration is needed to get the lift up and running. And if guidance is needed our support team is just one phone call away.

To facilitate the need of our customers and the installation location we have a variety of cabinets in different sizes and shapes.

Contact our sales department for more information.

Panels

Few things in a building are as noticeable as a lift. The lift becomes the natural meeting point for visitors, co-workers and neighbors on the way in and out of the building.

For brief moment perfect strangers meet in a confined space of but a few square feet and exchange pleasantries or awaits the destination in silence with their eyes fixed on a detail.

The lift has become such a natural part of everyday life that we've since far back have developed a social convention for how to travel in a lift. All this because there is few moments in life we let strangers so close.

The lift is such an important part of everyday life that if problems arise with a lift it can become a huge annoyance and cause disarray.

P Dahl has specialized in lift electronics and lift control units and strive to always produce products of high quality and durability - to fit in both everyday life and more exclusive settings.

We know the importance of having a system as foolproof and smooth as possible, a system easy to install and maintain.

We also know the importance of having an aesthetic lift car or a lift car adapted to the environment it is installed in. P Dahl offers both solutions for more exclusive settings and for environments that require more durable solutions.
